William Hill Interview Task

Sportsbook backend developer assessment (1 week)

The purpose of this assessment is to understand how you write and test your code.

We'd like to create a service that is able to handle football scoreboards on sports events.

Event: Team A vs Team B
Score: 1-0

This service should be able to create, find and update scoreboards and store them through a persistence layer.

Additionally, we'd like to enhance a mechanism to push scores updates to the client's browser.

We are expecting the task to be correct, but we are also interested on test coverage and strategies used. Please include a README.md with the instructions to run and test the service.

Technologies expected: Java 11, Spring Boot, maven or gradle.

Good luck!
